

Catering Service Management System

System Description

A Catering Service Management System is a web-based application developed using Node.js that helps manage catering operations such as customer bookings, menu selection, event scheduling, payments, and service monitoring. The system allows customers to book catering services online while administrators manage orders, staff, and event details.

This system improves efficiency by organizing transactions, reducing manual record-keeping, and making it easier for both customers and administrators to track catering requests and services.

Actors / Users

- Customer
- Administrator
- Staff

Main System Functions

- Register/Login
- Browse Packages/Menu
- Book Catering Service
- Manage Orders
- Manage Payments
- Assign Staff
- Generate Reports
- Track Booking Status

Short Description

The Catering Service Management System allows customers to book catering services online and select menu packages for events. Administrators manage customer information, bookings, payments, and reports. Staff can view assigned schedules and update service status. The system ensures smooth catering operations and faster transaction processing.
